Introduction

- ▶ Speech recognition is widely used in real-world applications.
- ▶ Accents pose a significant challenge for ASR systems.
- ▶ Robust accent classification models improve ASR accuracy.

State-of-the-Art Methods

- ▶ **Variational Mode Decomposition (VMD) + MFCC:** Enhances speech signal clarity before feature extraction.
- ▶ **Support Vector Machines (SVM):** Effective for structured feature-based classification.
- ▶ **Convolutional Neural Networks (CNNs):** Captures spatial patterns from spectrogram representations.
- ▶ **Hybrid Models (CNN-LSTM):** Leverages both spatial and temporal features.

Evaluation Metrics

- ▶ **Accuracy:** Measures correctly classified instances.
- ▶ **Precision and Recall:** Evaluate model reliability across different accents.
- ▶ **F1-Score:** Balances precision and recall.
- ▶ **Confusion Matrix:** Analyzes model misclassifications.

Comparison of Methods

Method	Accuracy	Precision	Recall	F1-Score
MFCC + MPSA-DenseNet	72.9%	72.4%	72.7%	72.8%
MFCC + 1D CNN-BiGRU-Attention	80.5%	79.8%	78.5%	79.0%
MFCC + SVM	92.5%	91.6%	92.0%	91.8%
MFCC + CNN + LSTM	98.63%	97.0%	96.5%	96.7%
VMD + MFCC + SVM (Proposed)	99.3%	99.1%	99.5%	99.2%

Table: Performance comparison of accent classification models.

Conclusion and Future Directions

- ▶ VMD + MFCC significantly improves accent classification.
- ▶ Future work includes:
 - ▶ Enhancing model generalization to unseen accents.
 - ▶ Developing lightweight models for real-time applications.
 - ▶ Addressing ethical concerns in accent bias.
